

Welcome

You are reading the index page of the eBMS SIMPLE Field Guide.

In this Pack, you will find documentation on the various parts of an eBMS / Nimblex implementation. Implementing a new system is a complicated task, with a lot of moving parts. To help you take it in, we have developed this package in several smaller guides so that you can digest them one at a time.

The Guide:

Document	Title	Content
S1	SIMPLE Project Introduction	An introduction to the SIMPLE Project Implementation Methodology. Start here to learn the process that we will follow in implementing your system.
S2	SIMPLE Requirements (Stage 1)	A project should consist of three parts: 1) Requirements, 2) Building and 3) Launch. This document explains the first.
S3	SIMPLE The Build (Stage 2)	Explains the Build and Configuration of your system.
S4	SIMPLE Launch (Stage 3)	Explains UAT (User Acceptance Testing), Training and Release to Production.
I1	Data Migration	When transitioning from an old system to a new system, you will often want to take your data with you. This document explains the process.
I2	Infrastructure and Integration	Defines the IT Infrastructure and Integration requirements.
G1	Support	Explains eBMS' support services.

Please talk to your account manager if you need further information or clarification on any item.

Warm Regards,

The eBMS Team
